# How to use Qualys v2 API with Data Feed.
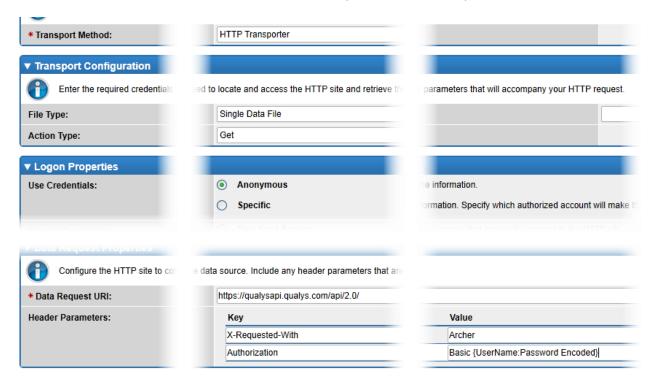

1) Use HTTP Transporter
2) Keep the credentials set to "Anonymous"
3) Add the URL to the Qualys file being downloaded

Now here's the real trick…

4) Add two headers
   a. *X-Requested-With* with a value of *Archer*
   b. *Authentication* with a value of *Basic* + your username and password base 64 encoded.

You can also use an online encoder to encode your user name and password. Make sure to place a colon between the two values.

Here is the one I use…
https://www.base64encode.org/

Here is an example: "*test:test!!*" would encode to "*dGVzdDp0ZXN0ISE=*", so the value placed in the Authorization header would be "*Basic dGVzdDp0ZXN0ISE=*"
